

Figure 7. *Myopsalta coolahensis*—illustration of male pygofer and internal genitalia; (A) viewed laterally from the left; (B) viewed ventrally; (C) aedeagus, lateral view; and (D) aedeagus, rotated 30° left from central view. See caption to Fig. 3 for abbreviations.

Etymology. The name is based on the locality where this species has been found—the Coolah region of New South Wales.

Description. Male (Figs 2B, 6A–B). *Head* including outer margins of eyes slightly wider than mesonotum; largely black, with ochraceous triangular marking anterior to ocelli, apex directed anteriorly over postclypeus, ocelli pink to clear; postclypeus black centrally sometimes with central narrow longitudinal ochraceous line extending ventrally along medial surface, black transverse grooves,

lateral margins ochraceous; anteclypeus shiny black; rostrum black, with length almost reaching anterior edge of posterior coxae; eyes black; antennae black, supra-antennal plates black.

Thorax mainly black. Pronotum black; pronotal collar shiny black with lateral margins rounded, wider than mesonotum. Mesonotum black; cruciform elevation black, lateral posterior margin variably ochraceous; metanotum black, lighter along dorsal ridge.

Legs with coxae striped black and ochraceous longitudinally, with black lateral fascia; femora also variably
